CRITICAL REVIEW FORM: SYSTEMATIC REVIEW

Citation: Oczkowski SJW, Duan EH, Groen A, Warren D, Cook DJ. The use of bowel protocols in critically ill adult patients: a systematic review and meta-analysis. Crit Care Med 2017 Mar 27. doi: 0.1097/CCM.000000000002315. [Epub ahead of print].

Assessing the Credibility of the Systematic Review Process	
Did the review explicitly address a	
sensible clinical question?	
Was the search for relevant studies	
exhaustive?	
Were selection and assessment of studies	
reproducible?	
Did the review address possible	
explanations of between-study	
differences in results?	
Did the review precent regults that are	
Did the review present results that are ready for clinical application?	
ready for chinical application:	
Did the review provide a rating for	
confidence in effect estimates or provide	
the information I need to evaluate	
confidence (e.g. risk of bias in included	
studies)?	
Dating the Auglity of I	
Kating the Quanty of I	Evidence (the confidence in the estimates)
	tional studies start low; then confidence rating can be decreased or increased
	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)?	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population,	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval represented the truth (i.e., imprecision	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval represented the truth (i.e., imprecision which occurs with a small number of	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval represented the truth (i.e., imprecision which occurs with a small number of events and wide confidence intervals)?	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval represented the truth (i.e., imprecision which occurs with a small number of events and wide confidence intervals)? Are the results inconsistent across	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval represented the truth (i.e., imprecision which occurs with a small number of events and wide confidence intervals)? Are the results inconsistent across studies (i.e., inconsistency)?	tional studies start low; then confidence rating can be decreased
Randomized trials start high and observa What is the risk of bias across all the studies (i.e., methodological limitations)? Do the systematic review population, intervention, comparison, and outcomes fit the patient at hand (i.e., indirectness)? Would your decisions differ if either boundary of the confidence interval represented the truth (i.e., imprecision which occurs with a small number of events and wide confidence intervals)? Are the results inconsistent across studies (i.e., inconsistency)? Is there a high likelihood of publication	tional studies start low; then confidence rating can be decreased

Are the results inconsistent across studies (i.e., inconsistency)?	tional studies start low; then confidence rating can be decreased

Do you consider the magnitude of treatment effect large (e.g. RR> 2.0 or <0.5)?	
Overall confidence in the estimates
